PROFESSIONAL SUMMARY

Product Manager with 8 years in product, most recently as sole PM of a \$40M ARR enterprise platform (3,500 accounts, 25,000 users). I work in complex technical environments, owning platform and data systems: data pipelines, data integrity, migrations, and security. Disciplined prioritization protects revenue and retention. I build with AI hands-on (Claude/Gemini APIs, prompt engineering, eval design, local-first agentic tooling).

CORE SKILLS

Product Management: Product roadmap development, backlog prioritization, go-to-market strategy, OKRs, KPI definition, user story writing, stakeholder management, cross-functional collaboration, voice of customer (VoC), product lifecycle management, requirements gathering, A/B testing

Technical: Agile (Scrum/Kanban), SQL, Jira, Confluence, Google Analytics, Salesforce, Claude API, Gemini API, prompt engineering, LLM eval design, Claude Code, Gemini CLI, AI-assisted development, GitHub

Domain Expertise: B2B SaaS, enterprise software, legacy platform modernization, data integrity and ingestion systems, API product management, migration strategy, internal tooling, platform stabilization

WORK EXPERIENCE

Cision | Product Manager

September 2021 - January 2026

Sole PM for two enterprise B2B SaaS platforms (~\$40M ARR, ~3,500 accounts, ~25,000 users), owning platform strategy and execution through sustained organizational constraint (four engineering reductions and three executive transitions) while protecting revenue, retention, and platform stability.

- **Data Integrity:** Eliminated a 40% contact data drop-off caused by failing legacy data pipeline layers by designing a direct integration with the upstream source-of-truth database, reducing stale-data complaints to zero and removing the platform's primary documented churn driver.
- **Cost Reduction:** Identified and deprecated a legacy Canadian content aggregation platform by securing replacement data streams with full content parity in a single quarter, eliminating ~\$800K in annual contractor and maintenance costs and contributing to ~\$2M in cumulative infrastructure savings.
- **Migration Tooling:** Designed phased opt-in migration tooling that moved ~700 at-risk enterprise accounts at renewal with no measurable churn, succeeding where a prior forced-migration program had failed.
- **Security Backlog:** Resolved 90% of ~300 open penetration test vulnerabilities using a risk-weighted scoring model over a one-year phased program, without stalling core platform delivery.
- **Roadmap Synthesis:** Led quarterly PI planning cycles, synthesizing inputs from engineering, DevOps, DBA, CX, legal, and sales into a single prioritized roadmap, presented every quarter at the company all-hands to the full organization (audience of ~300).

Sterkly Services | Product Manager

February 2019 - August 2021

PM at a professional services firm, owning requirements translation, QA processes, and operational automation for a macOS security product and client delivery workflows.

- **Revenue Recovery:** Unblocked an estimated \$1M-\$3M in product revenue stalled by vendor certificate failures by driving an in-house certificate-procurement workflow for the product's browser extension.
- **Specs & QA:** Owned specs, backlog, and QA for the security product across a distributed engineering org spanning three countries, sustaining release cadence and quality standards.

Product Owner at a logistics and operations agency, automating fulfillment, onboarding, and prospect conversion workflows in partnership with a 2-3 person developer team.

- **Fulfillment Automation:** Replaced a manual laptop setup process with a custom automated deployment script, scaling throughput from 10 to 100+ units per day and saving \$34,000 annually on \$288,000 in managed vendor contracts.
- **Prospect Conversion:** Built the company's first automated prospect funnel (landing page + Salesforce) and co-built an internal Salesforce onboarding tool, together driving an estimated ~40% lift in prospect conversion and ~\$22,000 in annual savings.

PROJECTS

Applryr: AI-Powered Application Pipeline | Python, TypeScript, SQLite, Playwright, Gemini API, Claude API | 2025-2026

End-to-end system that sources job listings, scores JD fit, and generates grounded resumes/cover letters from a verified claims catalog. Built a deterministic content-grounding architecture to prevent LLM hallucination, treating output quality as a measurable product requirement. Surfaced and scored ~100 good-fit roles that I applied to, with human judgment kept at the go/no-go gate.

Xochitl: Agentic Personal AI System | Python, Ollama, Claude API | 2024-2025

Designed and built a terminal-native AI assistant with local-first model architecture, a multi-source research pipeline with confidence scoring and inline citations, and a planning pipeline for software projects.

- Built primarily local-first, running on on-device models by default with optional cloud routing for complex tasks, to test how far a local LLM can carry an agentic assistant without default API dependency.
- Designed a research pipeline that labels claims by evidence type (sourced fact, inference, assumption) and cites sources inline, making AI-generated research outputs auditable.

Cuentame: Vocabulary-First Language Tutor | Claude API, Python | 2025

Built a tutor that generates personalized lessons from a user's own journal and conversation logs, so the vocabulary comes from how they actually talk instead of a generic word list.

- Scoped to one specific problem with a simple pass/fail quality bar: does the generated vocabulary match what the user said that week?

EDUCATION

Bachelor of Business Administration, Major in Management

National University, San Diego, CA · 2019
